MEDIWALL
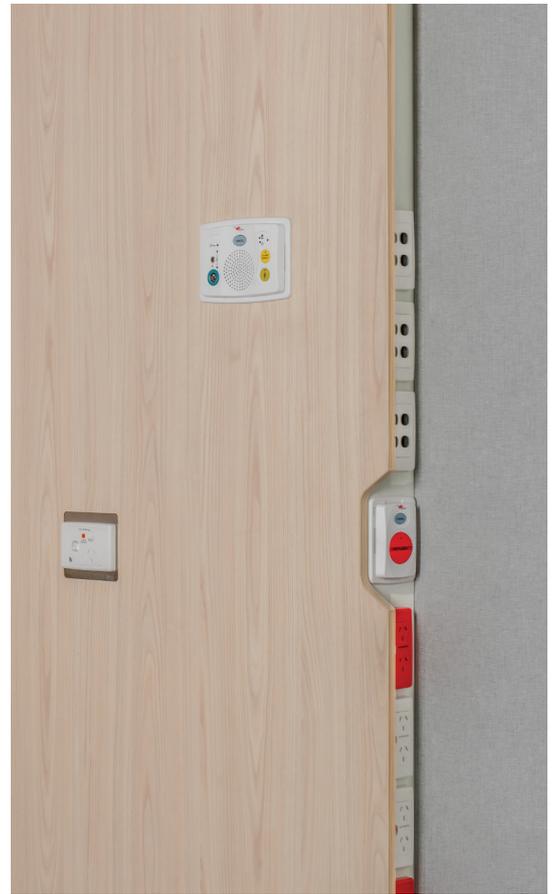

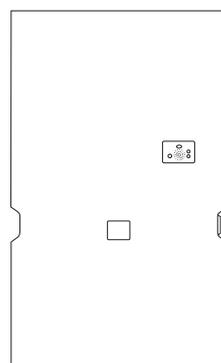

Promoting healing through design

Mediwall is a streamlined panel designed to conceal and reticulate healthcare services at the patient location. Replacing the need for traditional fixed joinery, the wall-mounted system provides services including power and data, medical gas terminals, nurse call systems, communications, dimmable lighting and more. The streamlined design also supports infection control and ease of maintenance by eliminating all external fixings where detritus build up can occur.
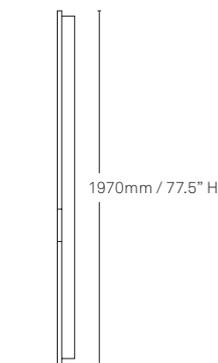

Studies consistently find a positive correlation between aesthetically pleasing spaces and a patient's recovery. The Mediwall helps to facilitate this recovery process by removing visual cues normally associated with stress and poor health such as cold metals, plugs and wires. A customisable panel, available in either a coloured powder coat, laminate or vinyl wrap, Mediwall negates the clinical feel of a space, making it feel more comforting and homely.

The pre-fabricated nature of the wall also speeds up patient room downtime, while providing easy reconfiguration if care needs or locations change.
